HAMILTON ORTHODONTICS

## Ultrasonic Cleaner with Retainers

Congratulations on completing your orthodontic treatment! As you embark on this next phase of oral health, effective care of your new retainers is crucial. However, keeping them clean can be a challenge. You can use a toothbrush and non-abrasive antibacterial soap to clean your retainers. Using toothpaste to clean retainers is not ideal as it can be abrasive causing tiny scratches on the retainer surface where bacteria can flourish. You must also be careful not to flex or tear your retainer while cleaning with a toothbrush. That's why ultrasonic retainer cleaners have become very popular among orthodontic patients.

Ultrasonic retainer cleaners use high-frequency sound waves to remove dirt, bacteria, and other debris from retainers while decreasing the risk of breakage, prolonging the life of your retainers. They are easy to use and gently clean your retainer in just a few minutes ensuring that it stays in good condition.
